# Programming the Atari 2600 Video Computer System

by Peter Dell ('JAC!')  
based on slides by Sven Oliver Moll ('SvOlli')

# Personal background (aka Moore's Law)

Soldered a ZX 81 together in 1984 (1k RAM)

Got an Atari 800 XL in 1986 (64k RAM)

Got an Amiga 500 in 1989 (512k RAM)

Got an Amiga 1200 in 1992 (2MB RAM)

Got a PC in 1995 (8 MB RAM)

Got a Book on the Atari VCS from 1977 in 2009

Got a VCS in 2010 (128 B RAM)

Work in HANA System in 2014 (100+TB RAM)

# Personal background (aka Moore's Law)

- Soldered a ZX 81 together in 1984 (1k RAM)
- Got an Atari 800 XL in 1986 (64k RAM)
- Got an Amiga 500 in 1989 (512k RAM)
- Got an Amiga 1200 in 1992 (2MB RAM)
- Got a PC in 1995 (3 MB RAM)
- Got a Book on the Atari VCS from 1977 in 2009
- Got a VCS in 2010 (128 B RAM)
- Work in HANA System in 2014 (100+TB RAM)

# What is it?

(and how could that work?)

# Atari's Rise in Game History

Founded 1972 by Nolan Bushnell and Ted Dabney

Best known for the arcade hit "Pong" (1972)

# Atari's Rise in Game History

Founded 1972 by Nolan Bushnell and Ted Dabney

Best known for the arcade hit "Pong" (1972)

# Atari's Rise in Game History

Atari's first home release was "Home Pong"

In 1975, Atari decided to produce a home game console based on a programmable design code named "Stella"

Primary goal: Make lots, lots, lots of money

- Sell lots of consoles (CPU,I/O,TV,RAM)
- Sell many game cartridges per console (ROM)

Primary issue: Cost of console parts (\$200 limit)

Primary design principle: Save cost for console

Produced until 1992 (15 years), 30 mio. units sold

# Revision Overview (1)

6 switch model, wood design (1977) (PAL: 1978)

# Hardware block diagram

## Atari 2600

**6507**

**CPU**

**6532: RIOT**

**Input / Output: 2 ports x 8 bit**

**RAM: 128 bytes (!), Timer**

**TIA**

**Output: video, 2 voices audio**

**Input: collision, pots**

## ROM Module

- 4k addressable memory
- game code
- kernel code
- graphics

## Input Devices

- Joystick
- Paddle
- Driving Controller
- Keypad
- Trackball

## Output Device

- Television

# Design Decisions (1)

CPU and chipset were off-the-shelf components  
(total \$12 vs. Intel/Motorola: \$150 - \$200)

6507 instead of 6502 CPU

(same CPU, less pins, smaller address space)

Use 6520 I/O chip for controller because 128 Bytes  
of RAM and a timer are already included  
(no separate RAM chip required)

No ROM with OS or charset in console

(game cartridge is cheaper to produce anyway)

# Design Decisions (2)

No frame buffer

(TV screen has ~32k pixels, nobody could pay 32k of RAM and CPU could not address it, too)

CPU drives display to keep graphics chip simple  
(no frame buffer/DMA/IRQ, "Racing the Beam")

CPU creates single line of TV picture at a time

- 21 bits of "screen memory", 40 pixel playfield
- 1 bit for the "ball"
- 8 bits each for "player 1" and "player 2" (8 pixel)
- 1 bit (pixel) each for "missile 1" and "missile 2"

# Game impressions

Basketball (Atari, 1978)

Hangman (Atari, 1978)

Pelé's Soccer (Atari, 1981)

Real Sports Soccer (Atari, 1987)

# People learn to use it

Pitfall (Activision, 1982)

Solaris (Atari, 1986)

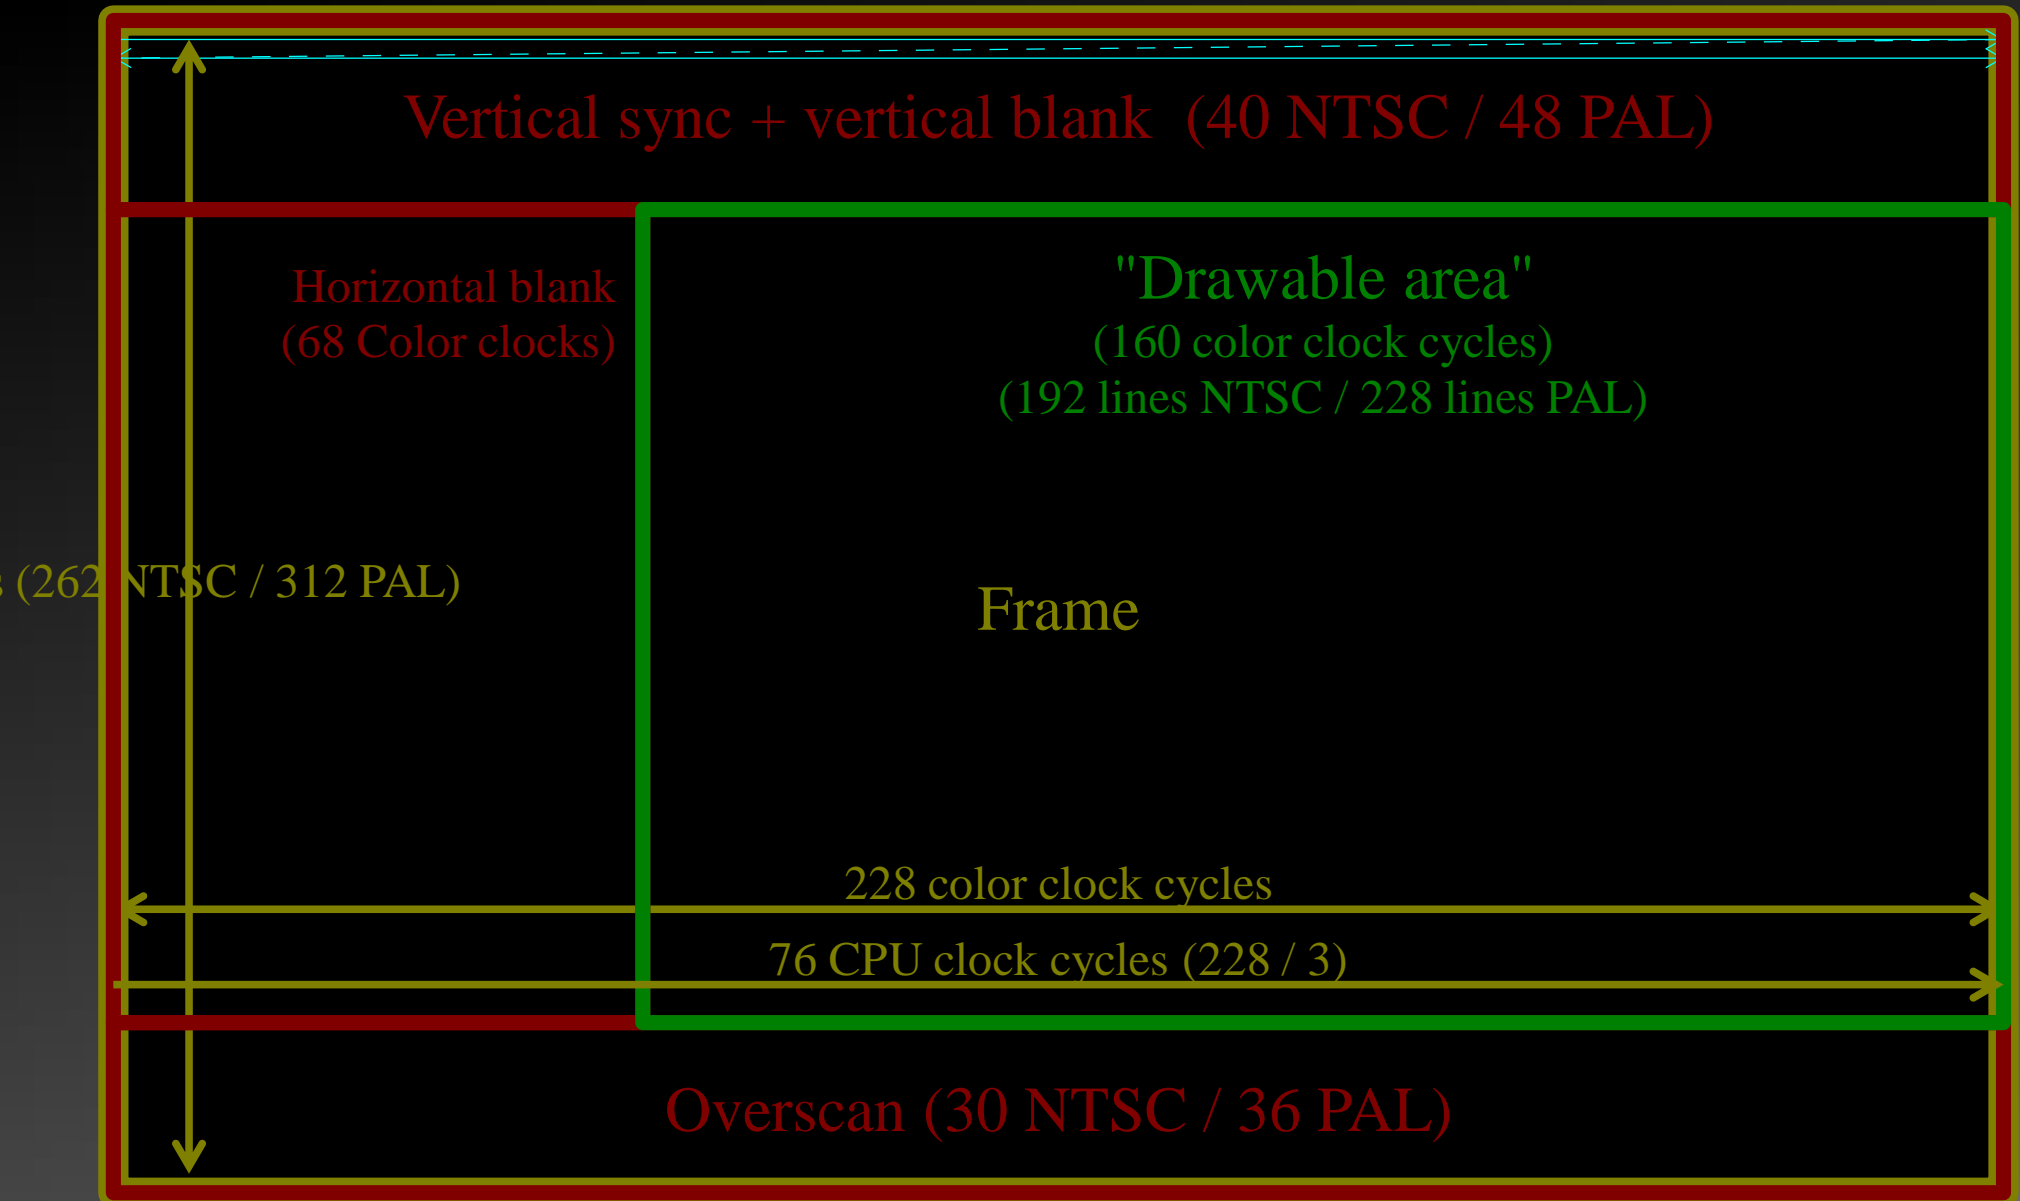

Beam Racer Demo (JAC!, 2011)

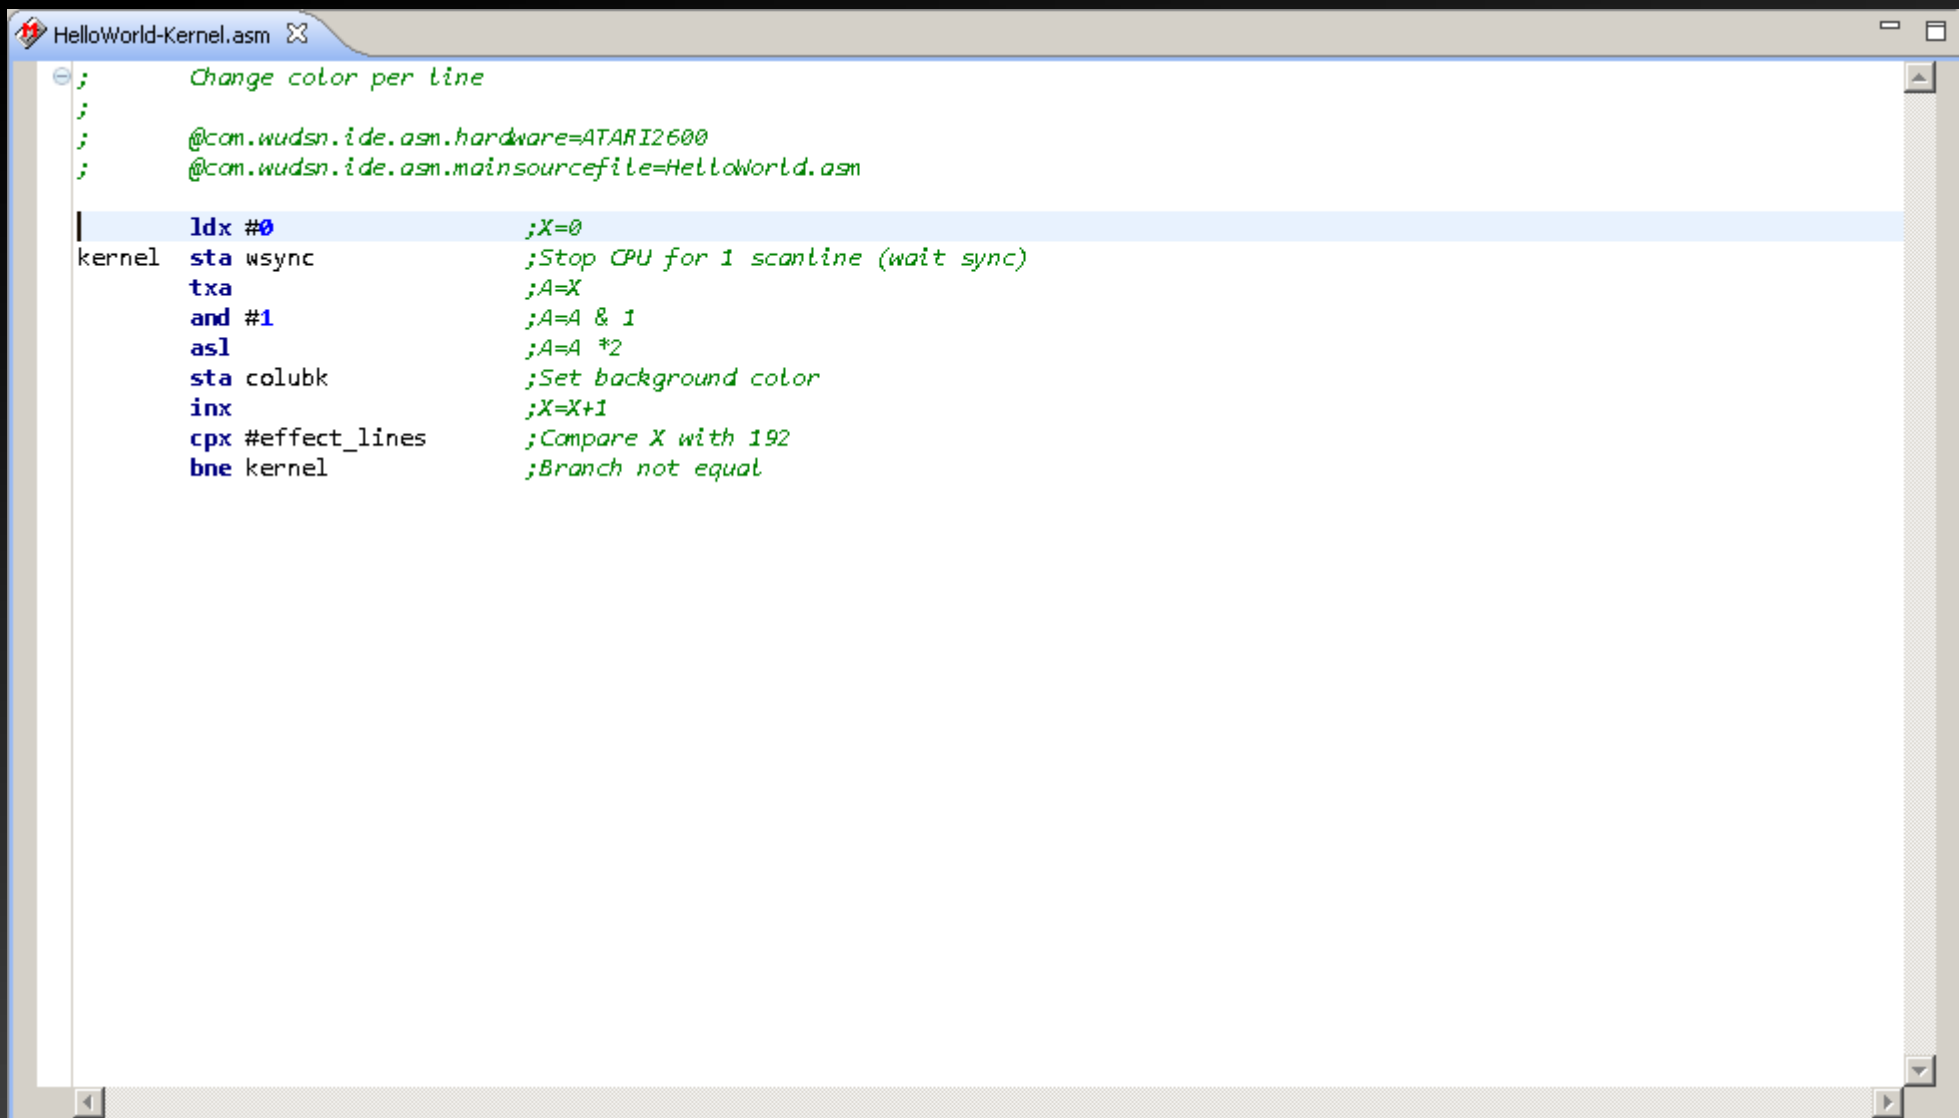

ISO Demo (JAC!, 2011)

# Display

# Famous last words...

## Original Atari documentation from 1979

### 3.0 RAM

The PIA has 128 bytes of RAM located in the Stella memory map from HEX address 80 to FF. The microprocessor stack is normally located from FF on down, and variables are normally located from 80 on up (hoping the two never meet).

Get the free IDE and start coding yourself...
